

Linux Terminal Cheat Sheet for DevOps

Navigation Commands

pwd – Show current directory

ls – List files

cd – Change directory

Use case: Navigating project directories on servers

```
pwd ls -la cd /var/www
```

File Operations

touch – Create file

cp – Copy file

mv – Move/rename file

rm – Delete file

Use case: Managing app files and logs

```
touch app.py cp app.py backup.py mv backup.py archive/ rm old.log
```

Text Processing

cat – View file

echo – Output text

grep – Search text

sed – Stream edit

awk – Pattern scanning

Use case: Parsing logs and configs

```
cat app.log grep ERROR app.log sed 's/old/new/' file.txt awk '{print $1}'  
file.txt
```

Permissions

chmod – Change permissions

chown – Change owner

sudo – Run as admin

Use case: Securing servers and deployments

```
chmod 755 script.sh chown user:user file sudo apt-get update
```

Package Management

apt-get – Debian/Ubuntu packages

yum – RedHat/CentOS packages

Use case: Installing dependencies on servers

```
sudo apt-get install nginx sudo yum install docker
```

Networking

ifconfig / ip – Network info

curl – HTTP requests

Use case: Testing APIs and connectivity

```
ip a curl http://example.com
```
